EXP 8

Data Visualization Using Tableau

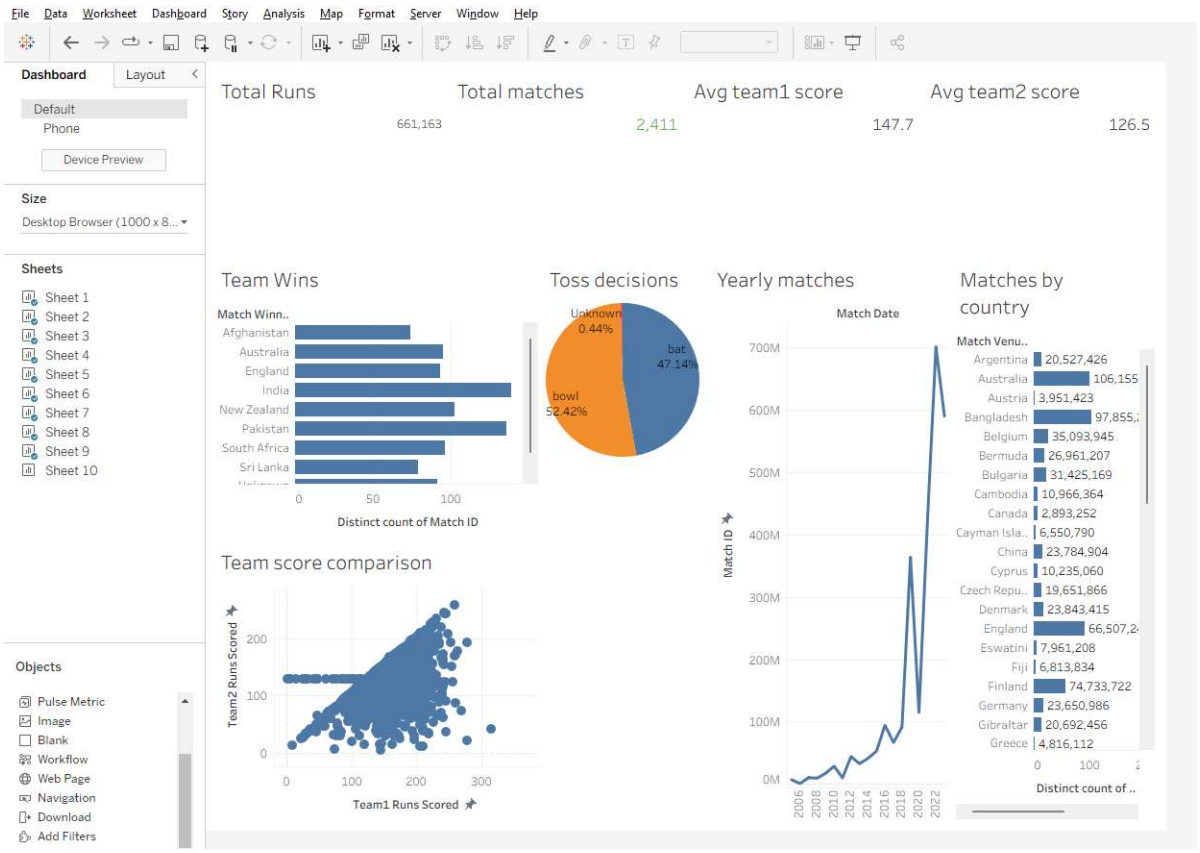

AIM:

To learn Tableau Desktop by connecting to a cleaned T20I cricket match dataset, preparing data, creating KPI cards and visualizations, and arranging them into an interactive dashboard to analyze match performance.

ALGORITHM:

1. Open Tableau Desktop and identify the Data pane, Worksheet area, Marks card, Show Me panel, and Dashboard workspace.
2. Connect to the cleaned T20I cricket match dataset using Text File and load the CSV data into Tableau.
3. Verify the dataset fields, including Match ID, Match Date, Team1 Name, Team1 Runs Scored, Team2 Name, Team2 Runs Scored, Match Winner, Toss Winner Choice, and Match Venue (Country).
4. Check the data types of the columns and ensure that match dates, team scores, match IDs, and categorical fields are correctly recognized.
5. Create a **Total Matches** KPI using the distinct count of Match ID and a **Total Runs** KPI by calculating the sum of Team1 Runs Scored and Team2 Runs Scored.
6. Create **Average Team 1 Score** and **Average Team 2 Score** KPI cards using the average of their respective team score fields.
7. Create a bar chart to display the number of matches won by each team using Match Winner and the distinct count of Match ID.
8. Create a line chart to analyze the yearly trend in T20I matches using Match Date and the distinct count of Match ID.
9. Create a pie chart to visualize toss decisions using Toss Winner Choice and the distinct count of Match ID.
10. Create a bar chart for matches by country and a scatter plot to compare Team1 Runs Scored with Team2 Runs Scored for individual matches.

OUTPUT:

RESULT:

Thus, the T20 International Cricket Match Performance Analytics Dashboard was created in Tableau to analyze match counts, total runs, average team scores, team wins, yearly match trends, toss decisions, country-wise matches, and team score comparisons.
